@\_albarron\_

# Overview

- Basics
- Algorithms
- Programming languages
- Baby steps into coding

# What is a programming language?

A programming language is **just another language**

A formal language comprising a set of **instructions** that produce various kinds of **output** [given an input]

Programming languages are used in computer programming to implement **algorithm**

[https://en.wikipedia.org/wiki/Programming\\_language](https://en.wikipedia.org/wiki/Programming_language)

# The *first* programmer

**Ada Lovelace\*** (Mathematician)

She published the first algorithm for Charles Babbage's **analytical engine**

\*she is Lord Byron's daughter

# Algorithm

A finite sequence of **well-defined, computer-implementable** instructions, typically to solve a class of problems or to perform a computation

<https://en.wikipedia.org/wiki/Algorithm>

**From the algorithm into the  
implementation**

**A real-life example**

**\*which is not 100 correct**

# The piadina maker: the ingredients

- 500g di farina 00
- 100g di latte
- 100g acqua
- 75g di strutto
- 2g di bicarbonato
- 15g di lievito istantaneo Pizzaiolo
- 10g di sale

Recipe from <http://www.algoritmucucina.it/piadina-romagnola/>

# The piadina maker: the recipe

1. Disporre la farina con sale, bicarbonato e lievito a fontana
2. Al centro aggiungere lo strutto
3. Mescolare il latte con l'acqua e versarlo sulla farina
4. Impastare energicamente fino ad ottenere una pasta compatta
5. Lasciar riposare per almeno 30 minuti
6. Dividere l'impasto in quattro palline, e stenderle formando dischi di circa 25 cm di diametro
7. Cuocere da entrambi i lati per 1m bucherellando con una forchetta
8. Farcire a piacere

# The piadina maker: into computing

- 500g di farina 00
- 100g di latte
- 100g acqua
- 75g di strutto
- 2g di bicarbonato
- 15g di lievito istantaneo Pizzaiolo
- 10g di sale

1. Disporre la farina con sale, bicarbonato e lievito a fontana
2. Al centro aggiungere lo strutto
3. Mescolare il latte con l'acqua e versarlo sulla farina

...

## Input/Output

→ ingredients (e.g., data)

← piadina (e.g., more data)

## Process

A series of instructions and routines

# The piadina maker: into code

## 1. Disporre la farina con sale, bicarbonato e lievito a fontana

```
def grabber(farina, sale, bicarbonato, lievito):  
    fontana = Fontana()  
    fontana.add(farina)  
    fontana.add(sale)  
    fontana.add(bicarbonato)  
    fontana.add(lievito)  
    return fontana
```

# The piadina maker: into code

## 2. Al centro aggiungere lo strutto

```
def strutter(fontana, strutto):  
    fontana.make_hole(position="center")  
    fontana.add(strutto)  
    return fontana
```

# The piadina maker: into code

## 3. Mescolare il latte con l'acqua e versarlo sulla farina

```
def liquid_mixer(latte, acqua):  
    contenitore = Contenitore(capacity = 300)  
    contenitore.add(latte)  
    contenitore.add(acqua)  
    contenitore.mix()  
    return contenitore
```

# The piadina maker: into code

## 4. Impastare energicamente fino ad ottenere una pasta compatta

```
import time  
fontana = grabber(farina, sale, bicarbonato, lievito)  
fontana = strutter(fontana, strutto)  
contenitore = liquid_mixer(latte, acqua):  
pasta = kneader(fontana, contenitore)
```

## 5. Lasciar riposare per almeno 30 minuti

```
time.sleep(1800)
```

# The piadina maker: into code

6. Dividere l'impasto in quattro palline, e stenderle formando dischi di circa 25 cm di diametro
7. Cuocere da entrambi i lati per 1m bucherellando con una forchetta
8. Farcire a piacere

# Quick overview of programming languages

# History of (some) flagship languages

year	language	highlights
1957	Fortran	compiled, imperative
1959	Lisp	Object-oriented, popular in AI, recursive functions
1964	Basic	Procedural, object-oriented (“goto”)
1970	Pascal	Imperative, procedural, lists, trees
1972	C	Procedural, recursion, static type system
1983	C++	Object-oriented, compiled, functional

# History of (some) flagship languages

year	language	highlights
1989	Python	Interpreted, object-oriented, code readability
1995	Java	compiled , object-oriented
1995	Javascript	Just-in-time-compiled, object-oriented, WWW
1995	PHP	Scripting, Web-oriented
2001	Visual Basic .NET	Object-oriented, .NET framework
2009	Go	Compiled, C-like (safer)

# Python is (among other things)...

## General-purpose

Applicable across application domains

## High-level

Strong abstraction from the computer (hardware)

## Interpreted

No previous compilation into machine-level instructions necessary

## (Not-necessarily) object-oriented paradigm

An object contains data (attributes) and procedures (methods)

# Some notable features (1/2)

- Elegant syntax (indentation-based) → easy to read
- Simple and ideal for prototyping
- It has a large standard library for diverse tasks (e.g., web servers, text search, file reading/modifying)
- Interactive mode → continuous snippet testing

<https://wiki.python.org/moin/BeginnersGuide/Overview>

## Some notable features (2/2)

- Extendable with modules in compiled languages (e.g., C++)
- Multi-platform (e.g., Mac OS X, MS Windows, Linux, Unix)
- Free: zero-cost to download/use; open-source license
- It has a large and friendly community

<https://wiki.python.org/moin/BeginnersGuide/Overview>

# Some programming-language features

- A variety of basic data types are available:
  - numbers (floating point, complex, integers) ← later today
  - strings (both ASCII and Unicode)
  - Lists
  - Dictionaries
- It supports object-oriented programming  
← 3rd session
- Code can be grouped into modules and packages

# Enough! Let us look at some code!

```
31 def __init__(self, path):
32     self.file = None
33     self.fingerprints = set()
34     self.logdups = True
35     self.debug = debug
36     self.logger = logging.getLogger(__name__)
37     if path:
38         self.file = open(os.path.join(path, 'requests.log'),
39                         'a')
40         self.file.seek(0)
41         self.fingerprints.update(self._get_fingerprints())
42
43 @classmethod
44 def from_settings(cls, settings):
45     debug = settings.getbool('SUPERSITO_DEBUG')
46     return cls(job_dir(settings), debug)
47
48 def request_seen(self, request):
49     fp = self.request_fingerprint(request)
50     if fp in self.fingerprints:
51         return True
52     self.fingerprints.add(fp)
53     if self.file:
54         self.file.write(fp + os.linesep)
55
56 def request_fingerprint(self, request):
57     return request_fingerprint(request)
```

# Google's colab

“a free **Jupyter notebook** environment that runs in the cloud and stores its notebooks on Google Drive”

<https://colab.research.google.com>

Let's go to our first jupyter notebook

# What we know so far: input/output

- `print()` displays stuff to the screen
- `input()` captures information from the user

# What we know so far: variables

<code>x = 5</code>	<ul style="list-style-type: none"><li>- <code>x</code> is a variable</li><li>- We assign values to a variable with '='</li></ul>	
	<ul style="list-style-type: none"><li>- <code>x = 5</code></li><li>- <code>x = 5.5</code></li><li>- <code>x = 'ciao'</code></li><li>- <code>x = "ciao"</code></li><li>- <code>x = '5'</code></li></ul>	<p>is an integer</p> <p>is a float</p> <p>is a string</p> <p>is also a string</p> <p>is what?</p>
<code>x = x * 3</code>	<ul style="list-style-type: none"><li>- We can apply operators to variables</li><li>- We can assign the output to a variable</li></ul>	

# What we know so far: flow control - conditionals

```
if (condition):  
    execute something  
elif (condition):  
    execute something  
else:  
    execute something
```

## How is this different?

```
if (condition):  
    execute something  
if (condition):  
    execute something  
else:  
    execute something
```

Only one of these three snippets is executed

# What we know so far: flow control - loops

`for(iterator):`

`execute something`

`while(condition):`

`execute something`

The code snippet will be executed during a number of iterations

\* Danger: if you make a mistake, a loop could run forever

# What we know so far: basic formatting

```
# my code
x = 0
while x < 50:
    for i in range(x):
        print('x', end="")
    print()
    x += 1
```

- Comments start with **#**
- A **line break** is enough to close an instruction (in Java or C, we need ;)
- **Colon** opens a *special* code snippet
- **Indentation is crucial**

# You know a lot already!

# It is your turn to play with the notebook
